

Poly Processing Factory Tank Inspection

Pro-Active Tank Inspection To Insure The Longevity Of Your Investment

Poly Processing Company recommends routine inspections to ensure the tank is in proper working condition. Poly Processing Company offers tank inspections to protect the integrity of the chemical stored, and help extend the useful life of the tank.

The following is included in the general tank inspection:

- **EXTERIOR AND INTERIOR** - Visual inspection of the exterior and interior of the tank for cracking, brittle appearance and other signs the tank is reaching the end of its useful life. In some cases the top 1/32" of a small area of the outer surface may be scraped off to inspect the depth of the cracking and/or hazing.
- **FITTINGS AND ATTACHMENTS** - Visual inspection of all fittings and attachments. When possible, gaskets to be visually inspected for signs of fatigue. Bolt torque to be checked on all bolted fittings attached to the tank. Visual inspection to be performed on flexible connections to ensure they are functioning properly. Valves to be visually inspected for signs of leakage.
- **VENT LINE** - When possible, vent line(s) to be inspected for restrictions and/or obstructions. Vent sizing to be evaluated and recommendations made for improvement. If applicable, scrubber tank to be visually inspected.
- **EXTERNAL** - Visual inspection of ladders, brackets, stabilizers, seismic systems and stands for signs of corrosion.

* Report - A written report will be included in the tank inspection service.
