

B.O.S.S.® Fitting

Bolted One-Piece Sure Seal Prevents Leaks

The B.O.S.S.® Fitting adds value to your tank installation:

1. One-piece design reduces seal point to a single gasket.
2. Polyethylene construction assures you of the same chemical compatibility as your tank.
3. Innovative backing ring design reduces stress on the fitting and makes it three times stronger than similar plastic fittings.
4. Easy to maintain and troubleshoot because the pipe connection is extended beyond the sidewall of the tank.

About the Design

- An innovative design concept that protects the cross section of OR-1000® tank systems.
- Made of polyethylene.
- Three alloy options: 316 Stainless Steel, Titanium and C-276.
- Installed through tank wall as with any standard bulkhead fitting.
- Comes fully assembled and pressure-tested.
- Streamlined fitting; one full-face gasket is the single sealing point and internal and external connection nipples are molded into the fitting.
- Assured chemical compatibility through the use of polyethylene construction.
- Increased strength by connecting all of the stud bolts to a robust common-alloy backing ring.

As with all fittings, a flexible connection is still required on the bottom one-third of the sidewall.
